Keyed Mounting Templates for Press Brakes

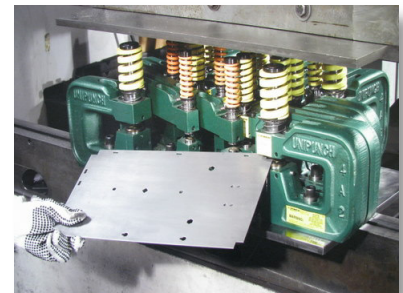

Mount it - Clamp it - Punch it!

June 2011

If you are producing recurring parts in small, medium or even large sized batches, look to **UniPunch** for real value solutions.

We make it easy by providing our **Keyed Mounting Templates** that are compatible with most press brake bed designs.

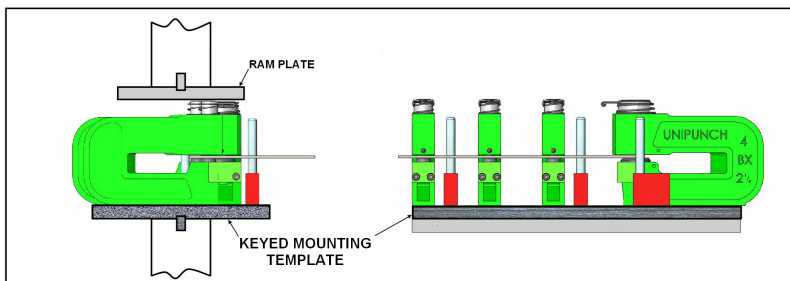

Drilled and reamed holes in the template are in precise location of the part to be punched. For typical press brake mounting, a 1/2" key is centered at the base of the template. Offset key locations are available upon request.

Standard UniPunch A-series Tooling mounted on a dedicated keyed mounting template producing a complete part in one press stroke.

Our Keyed Mounting Templates feature:

- High accuracy for maintaining hole to hole tolerances
- Machined marked tooling and gauging positions are provided for fast setups (engineering reference drawings provided)
- Templates can be made to accommodate multiple part families
- Lengths up to 14' are available
- Template widths are engineered to part specifications
- Standard or custom tooling compatible

Our keyed mounting templates are designed to accurately position UniPunch units and part gauging stops. In many cases, templates can accommodate multiple parts or hole pattern variations.

Simply provide a part drawing or sketch and our engineers will review your application and provide a timely quote.

Email to info@unipunch.com

For a tooling quotation, just provide drawings or CAD files.

Our engineering department will review your requirements and recommend tooling for your application.
